

Elastic Odoo Connector

Bring Odoo's pricing and inventory together with product content from Shopify for richer selling in Elastic. Purpose-built availability calculations, flexible variant merchandising, and coordinated catalogs help reps build relevant assortments and buyers place informed orders. Orders flow into Odoo; history and tracking return to Elastic.

Availability that reflects demand

Give Elastic buyers time-phased stock availability that accounts for incoming supply and outgoing demand, with an optional BOM-based fallback that recognizes what can be built from available components.

Merchandising built for Elastic

Reuse Shopify product metadata alongside Odoo variant groupings, catalog placement, and dealer pricing to enrich Elastic's Digital Catalog, Custom Collections, Assortment Builder, and visual selling tools.

A seasonal dealer order

01 Curate

Publish a seasonal catalog with the right variant groupings and dealer prices. Build a tailored assortment in Elastic.

02 Order

Show dated availability that accounts for demand. Bring the dealer's submitted Elastic order into Odoo for fulfillment.

03 Fulfill

Process the order in Odoo. Send order history, shipment details, and available tracking back to Elastic.

Availability designed for wholesale selling

Give Elastic buyers a dated view of what they can order. Calculate available-to-sell quantities by warehouse using Odoo stock, receipts, and demand.

Time-phased ATS

Protect existing orders before offering more stock. The calculation carries shortages forward and checks future commitments backward, releasing only the uncommitted surplus as expected receipts become available.

With 20 on hand, the day 3 order needs 30: ATS is zero today. The day 7 receipt of 40 covers the 10-unit shortage and the later 12-unit order, releasing 18 units to sell.

BOM-based availability

Turn component stock into selling potential when finished-goods ATS is unavailable. Selected components are checked against reservations and future demand. Variant rules, unit conversions, and combined component usage determine buildable units; finished-goods commitments still come first.

Fit your stock policy

Optionally include draft and sent quotations as demand. Track each enabled warehouse separately, account for transfers between warehouses, and map customers to matching warehouse codes so the buying context and stock feed stay aligned.

ATS reflects configured Odoo data at each export. BOM estimates use current component stock; shared-component allocation, production capacity, and lead times are planned separately.

Odoo customizations for effective selling

Reuse the product content your ecommerce team already maintains, then combine it with Odoo's variant, pricing, and catalog controls to give Elastic buyers richer, more consistent product information.

Shopify product enrichment

Reuse ecommerce content to reduce duplicate product maintenance.

Import Shopify product fields and metafields into Odoo feature assignments. Map descriptions, features, or technology text; clean formatted content and remove duplicates before exporting it to Elastic.

Merchandising by variant

Present product combinations the way buyers shop in Elastic.

Combine style and attribute codes into Elastic item numbers. Choose color and size attributes, retain variant overrides, and publish descriptive names so buyers see product groupings that fit your range.

Catalogs that stay aligned

Keep curated selling experiences consistent as the range changes.

One membership source drives product placement and catalog pricing. Mappings refresh from catalog assignments while preserving manual sort order, keeping Custom Collections and proposals aligned as the range changes.

Dealer pricing from Odoo

Carry account pricing into Elastic's buying experience.

Assigned Odoo pricelists publish automatically with variant-aware prices and matching customer price groups. Additional price levels and list-price fallback support different selling needs without repeating account setup.

Account and rep continuity

Preserve customer relationships from selling through order intake.

Publish employee reps, account assignments, and an optional shared house rep. Legacy IDs and connection-specific Sold-To and Ship-To mappings help orders reach the right Odoo customer and delivery address.

Controlled publishing

Keep the merchandise promoted in Elastic tied to eligible Odoo items.

Catalog membership, sync flags, and required identifiers govern products and related feeds. Customer sync controls define included accounts, keeping collections, assortments, and Sales Campaigns tied to eligible Odoo merchandise.

Shopify metadata import is built in. Additional ecommerce metadata connections can be scoped on request. Imagery, Whiteboards, and campaign design remain part of Elastic's content workflows.

Elastic orders connected to Odoo

ELASTIC TO ODOO

From buying to fulfillment

An order submitted in Elastic enters Odoo through staging. The connector groups order and shipment rows, resolves Sold-To and Ship-To accounts, and matches products before creating draft sales orders. Automatic confirmation is optional.

Duplicate checks and retry controls help teams resolve exceptions without rekeying the order. Staged records retain source data and errors for review; processed source files can be archived.

ODOO TO ELASTIC

Order history and tracking

Give customers order history and fulfillment visibility in Elastic. Odoo supplies order details, quantities, monetary totals, shipment information, and available tracking numbers and links, helping buyers follow their orders in the same platform where they shop.

History includes eligible Odoo-originated and Elastic-originated orders. Both files are validated before upload, and stable order and line keys support repeat updates as fulfillment progresses.

Daily operation in Odoo

Secure connections

Use separate Beta and Production profiles with password or SSH-key authentication and stored host-key verification. Validate the connected buying workflow before production cutover.

Scheduling and visibility

Manage product, customer, inventory, order-history, and order-import schedules in Odoo. Run feeds manually and inspect logs. Data freshness follows the agreed export, transfer, and Elastic import cadence.

Plan your rollout

01 Align

Define variant groupings, dealer pricing, warehouse availability, and BOM component policies for your Elastic experience.

02 Validate

Test a dealer journey from assortment and dated availability through ordering, Odoo fulfillment, and Elastic history.

03 Activate

Enable agreed feeds and schedules, confirm Elastic content setup, and assign daily review ownership.

Built for Odoo 18.0 with Elastic SFTP exchange. Requires connector dependencies, including the employee sales-rep add-on, and configured Elastic access. Elastic features and content are enabled and managed within your platform setup.

Plan your connected wholesale workflow with Elastic and your Odoo team.
